STARS NAMED AFTER ASTRONOMER'S NAMES

F. SPITE and R. LAHMEK
Observatoire de Meudon

The problem of the designation of faint stars has been discussed many times (see for example IAU, 1979), but it is a difficult one, and it has not yet been satisfactorily solved. In the case of very peculiar stars, one of the way to solve this problem is to use the personal name of the discoverer, and this has been done rather often during the last years. However, for the non-specialist in the field, a star designated by an astronomer's name is not easy to identify. Therefore, we gather here the designations that we encountered in the course of our work for the BSI (Cayrel et al., 1976; Ochsenbein and Spite, 1976; Ochsenbein, 1981).

We first list a few rather bright stars which have also a "classical" designation such as HD (Henry Draper Catalogue, Pickering, 1918) or BD (Bonner Durchmusterung, Schönfeld, 1886). In the first list, we provide only the cross-identification.

The second list is relative to faint stars. Where existing, we give the cross-identifications. We give the basic data, i.e. the coordinates for the 1950 equinox, and the visual magnitude (or magnitudes when the star is variable). We give the bibliographic references of the paper providing the coordinates.

We hope that these lists may be useful for the astronomical community, and we would be grateful to those people who would take care of informing us about any error or omission in these lists.
